BUTE NTICL*

In several cases, but especially in the case of public PC rooms, it is very important to be able to reinstall the workstations quickly and with minimal effort. In the case of machines with similar hardware, it is often the simplest solution to copy the settings and the file systems of a master PC to the others. One such free copy tool is uPi, which is capable of reinstalling a typical workstation in 10-30 minutes from an FTP server, using a Linux boot floppy. The presentation is about its technical details and examples of use in the BUTE NTICL, where it has been developed.
