

## **A report repository: Cinege / Purple**

We may find quite a lot definitions for a "repository" and "data warehouse", but basically a repository is a bunch of files stored long-term in an ordered and searchable way. When these files are reports, we are speaking about a report repository. If these files are generated from a database, it is not so simple anymore to find a theoretical category.

So, let's grab a pile of files, order them hierarchically in a way that the files are easy to find, easy to reach, easy to backup and recover, thus creating a framework, which should be secure, easy to configure and easy to customize.

One such report-repository (framework) is Cinege/Purple. This presentation is about the architecture, the configuration and the use of Cinege/Purple.
