

"A window" opening to the museums: Special databases of The Museum of Literature Petőfi in the HunTéka system

Keeping the records of a library or a museum are similar questions. In the special databases of the *Museum of Literature Petőfi (PIM)* we can see a good example of it. The databases of PIM mostly use data structures which are commonly used in library systems (such as bibliographic data, biographic data of authors). In the *HunTéka* Library System a new (Name) authority control record structure was established by the broadening of the HUNMARC Authority Data standard which can serve as a good example for further development of such structures. Within the Authority File a new, thesaurus-like relationship was created between the Personal Name records themselves and between the Personal Name, Geographic Name and Corporate Name records.

The records of the Art Collections have been converted into the Museum Module of HunTéka, that has been newly developed corresponding to the directives of NKÖM .

This lecture aims with this concrete realization to illustrate the flexibility and unutilized possibilities of the HUNMARC standard. The originally library standard can be broaden into the field of Museums and special Archives.
